DESCRIPTORS: \*Refractory materials, Quartz,  
Iron compounds, Nickel compounds, Chromium  
compounds, Oxides, Combustion, Catalysis.

This work established that quartz packing accelerates  
the combustion, especially at temperatures below  
700° and that fire clay grog is more active than  
quartz at temperatures higher than 700°, but at lower  
temperatures the relationship is reversed. Oxides of  
nickel and iron exert a higher promoting effect than  
vanadium oxides and permit a lowering of the
